DIMOSTRAZIONE 1 (Principio d'induzione e binomio di Newton). IPOTESI: P(n) è vera

$$P(n) = (a+b)^n = \sum_{k=0}^n {n \choose k} a^k b^{n-k}$$
 (1)

Per il principio di induzione dovremmo essere capaci di dimostrare anche: P(n+1) come vera.

$$P(n+1) = (a+b)^{n+1} = \sum_{k=0}^{n+1} {k \choose n+1} a^k b^{n+1-k}$$
 (2)

$$(a+b)^{n+1} = (a+b)(a+b)^n \Rightarrow (a+b)\sum_{k=0}^n \binom{k}{n} a^k b^{n-k}$$
 (3)

Ricordiamo la proprietà distributiva: (a+b)c = ac+bc

$$\sum_{k=0}^{n} \binom{k}{n} a^{k+1} b^{n-k} + \sum_{k=0}^{n} \binom{k}{n} a^{k} b^{n+1-k}$$

$$\downarrow \downarrow$$

$$(4)$$

$$\sum_{k=1}^{n+1} {k-1 \choose n} a^k b^{n+1-k} + \sum_{k=0}^{n} {k \choose n} a^k b^{n+1-k} + {0 \choose n} a^0 b^{n+1-0}$$

$$\parallel$$
(5)

$$\sum_{k=0}^{n+1} \left[\binom{k-1}{n} + \binom{k}{n} \right] a^k b^{n+1-k} \tag{6}$$

$$\frac{n!}{(k-1)!(n-k+1)!} + \frac{n!}{k!(n-k)!} = \frac{\underline{n!}}{(\underline{k-1})!(n-k+1)(\underline{n-k})!} + \frac{\underline{n!}}{k\underline{(k-1)!}} + \frac{\underline{n!}}{(7)}$$

$$\frac{n!}{(k-1)!(n-k)!} \left(\frac{1}{(n-k+1)} + \frac{1}{k} \right)$$
 (8)

 $\downarrow \downarrow$

$$\frac{n!}{(k-1)!(n-k)!} \cdot \frac{\cancel{k}+n-\cancel{k}+1}{k(n-k+1)}$$

$$\downarrow \downarrow \qquad (9)$$

$$\underbrace{\frac{n!}{(k-1)!(n-k)!} \cdot \frac{n+1}{k(n-k+1)}} = \underbrace{\frac{(n+1!)}{k!((n+1)-k)!}}$$
(10)

L'ultima semplificazione è conseguenza di: $(n+1)! = (n+1) \cdot n!$ e di $(n-1)! \cdot n = n!$

In conclusione abbiamo che:

$$\sum_{k=0}^{n+1} \left[\binom{k-1}{n} + \binom{k}{n} \right] a^k b^{n+1-k} = \sum_{k=0}^{n+1} \binom{k}{n+1} a^k b^{n+1-k} = (a+b)^{n+1}$$
 (11)

DIMOSTRAZIONE 2 $(x^n < y)$.

$$x^n < y \iff \exists \epsilon \in \mathbb{R}, \epsilon > 0 : (x + \epsilon)^n < y$$
 (12)

Sia $\epsilon \in]0,1[$

$$(x+\epsilon)^n = ((x+\epsilon)^n - x^n) + x^n = ((x+\epsilon) - x)((x+\epsilon)^{n-1} + \dots + x^{n-1}) + x^n$$
(13)

$$\downarrow \downarrow \qquad \qquad (14)$$

$$\epsilon((x+\epsilon)^{n-1} + \dots + x^{n-1}) + x^n \le \epsilon \cdot n \cdot (x+1)^{n-1} + x^n$$
 (15)

$$\downarrow \hspace{1cm} (16)$$

$$\epsilon n(x+1)^{n-1} + x^n < y \iff \epsilon < \frac{y - x^n}{n(x+1)^{n-1}} \stackrel{def.}{=} \epsilon > 0$$
 (17)

$$0 < \epsilon < \frac{y - x^n}{n(x+1)^{n-1}} \tag{18}$$

Questo è valido per: $\epsilon \in \mathbb{R}$

$$a > 1$$
 $a^n > 1$ $\forall n \in \mathbb{Q}, n > 0$ $p, q \in \mathbb{N} \land q \neq 0 : n = \frac{p}{q}$ (19)

$$a^n = \sqrt[q]{a^p} \ge \sqrt[q]{a} > \sqrt[q]{1} = 1 \tag{20}$$

Questo perchè $a^n > 1 \land a > 1 \implies 1,00000000001^n > 1$ Dalle proprietà delle potenze ricordiamo che:

$$x < y \implies a^x < a^y \implies \frac{1}{a^x} > \frac{1}{x^y} \tag{21}$$

$$x - y < 0 \stackrel{\cdot (-1)}{\Longrightarrow} y - x > 0 \tag{22}$$

$$a^x - a^y < 0 \stackrel{\cdot (-1)}{\Longrightarrow} a^y - a^x > 0$$
 (23)

$$\underbrace{a^x}_{>0} \underbrace{(a^{y-x} - 1)}_{a^n > 1} > 0 \tag{25}$$

DIMOSTRAZIONE 3 (Il limite se esiste è unico).

$$\lim_{x \to \infty} a_n = l \quad \land \quad \lim_{x \to \infty} a_n = m \quad \iff \quad l = m \tag{26}$$

Esempio 1.

Poniamo per assurdo che $l \neq m$ Fissiamo $\epsilon > 0$

$$\underbrace{|a_n - l| < \frac{\epsilon}{2}}_{n > \overline{n_1}} & \underbrace{|a_n - m| < \frac{\epsilon}{2}}_{n > \overline{n_2}}$$

$$(27)$$

 $\downarrow \downarrow$

Ricordiamo che $|a_n - m| = |m - a_n|$

$$| -a_n - l - -a_n + m | |a_n - l| + |m - a_n| < \frac{\epsilon}{2} + \frac{\epsilon}{2} = \epsilon$$
 (28)

$$|m-l| < \epsilon \implies |m-l| = 0$$
 (29)

Ma questo è assurdo perchè: $\epsilon > 0, \forall \epsilon \in \mathbb{R}$

$$m = l (30)$$

DIMOSTRAZIONE 4 (Limiti).

Se $\{a_n\}_{n\in\mathbb{N}}$ converge $l\in\mathbb{R}$ \Longrightarrow $\{a_{k_n}\}_{k_n\in\mathbb{N}}$ converge $l\in\mathbb{R}$

Si ha che:

$$\forall \epsilon > 0 \ \exists \overline{n} \in \mathbb{N} : n > \overline{n} \implies |a_n - l| < \epsilon \tag{31}$$

$$\forall \epsilon > 0 \ \exists \overline{n} \in \mathbb{N} : n > \overline{n} \implies |a_{k_n} - l| < \epsilon$$
 (32)

$$\lim_{n \to \infty} a_{k_n} = l \tag{33}$$

Esempio 2.

$$\lim_{n \to +\infty} \frac{1}{n} = 0 \qquad \& \qquad k = 2, \lim_{k_n \to +\infty} \frac{1}{k_n} = 0 \tag{34}$$

DIMOSTRAZIONE 5.

$$\lim_{n \to +\infty} = l + m \tag{35}$$

$$\lim_{n \to +\infty} a_n = l \quad \& \quad \lim_{n \to +\infty} b_n = m \tag{36}$$

 \parallel

$$|a_n - l| < \frac{\epsilon}{2} \quad \text{se} \quad n > \overline{n_1}$$
 (37)

$$|b_n - m| < \frac{\epsilon}{2} \quad \text{se} \quad n > \overline{n_2}$$
 (38)

 $n > \max\{\overline{n_1}, \overline{n_2}\}$

$$|a_n + b_n - l - m| \le |a_n - l| + |b_n - m| < \frac{\epsilon}{2} + \frac{\epsilon}{2} = \epsilon$$
 (39)

$$\downarrow \downarrow$$

$$\forall \epsilon > 0, \exists \overline{n} \equiv \max\{\overline{n_1}, \overline{n_2}\} : n > \overline{n} \Rightarrow \underbrace{|(a_n + b_n) - (l + m)|}_{0} < \epsilon$$
 (40)

$$(a_n + b_n) - (l + m) = 0 (41)$$

$$a_n + b_n = l + m \tag{42}$$

DIMOSTRAZIONE 6.

$$\forall \epsilon > 0, \exists \overline{n} \in \mathbb{N} : n > \overline{n} \Rightarrow \underbrace{|a_n - l < \epsilon|}_{l - \epsilon < a_n < l + \epsilon \quad \forall n > \overline{n}}$$

$$\tag{43}$$

$$\epsilon = |l|$$

Da questo otteniamo che

$$\underbrace{l-|l|}_{0} < a_n < \underbrace{l+|l|}_{2l} \tag{44}$$

In conclusione avremo che:

se
$$l > 0 \Rightarrow a_n > 0$$

se
$$l < 0 \Rightarrow a_n < 0$$

Definizione 1 (Teorema dei 2 carabinieri):

$$Se \underbrace{\{a_n\},\{b_n\}}_{convergono\ a},\{c_n\}$$

è ovvio che:
$$a_n \le c_n \le b_n \implies c_n converge \ a \ l$$
 (45)

DIMOSTRAZIONE 7.

$$\forall \epsilon > 0, \exists \overline{n_1}, \overline{n_2} \in \mathbb{N} : \tag{46}$$

 $\downarrow \downarrow$

$$l - \epsilon < a_n < l + \epsilon \qquad \& \qquad l - \epsilon < b_n < l + \epsilon \tag{47}$$

se $n > \max\{\overline{n_1}, \overline{n_2}\}$

$$\Downarrow$$

$$l - \epsilon < a_n \le c_n \le b_n < l + \epsilon \qquad \forall n > \overline{n}$$
 (48)

$$\underbrace{l - \epsilon < c_n < l + \epsilon}_{|c_n - l| < \epsilon} \Longrightarrow \lim_{n \to +\infty} c_n = l \tag{49}$$
